[SE] FragMAX screening of SARS CoV-2 nsp10-nsp14ExoN complex

To date, the SARS CoV-2 virus has infected >400 million people, causing ~6 million fatalities globally. Multiple research efforts are ongoing, aimed at different ways to target the virus, however there is still no magic bullet available. Current vaccines offer excellent protection...

Watching the release of a photopharmacological drug from tubulin using time-resolved serial crystallograph...

The binding and release of ligands from their protein targets is central to fundamental biological processes as well as to drug discovery. Photopharmacology introduces chemical triggers that allow the changing of ligand affinities and thus biological activity by light. Insight...

Search through scientific datasets and research publications

Look for research on magnetic diffuse scattering in CuMnO2 where the temperature is between 1.5 K and 300 K and the sample mass is 10,000.
